- Higher order functions
- Exceptions, input/output and imperative constructs
- Modules and data abstraction

## PRIME NUMBERS (30/30 points)

Let's define some usual arithmetical functions.

1. `gcd` that takes two non-negative integers `n` and `m`, and that returns the greatest common divisor of `n` and `m`, following Euclid's algorithm.
2. `multiple_upto : int -> int -> bool` that takes two non-negative integers `n` and `r`, and that tells whether `n` admits at least one divisor between `2` and `r`, inclusive. In other words that there exists a number `d >= 2` and `<= r`, such that the remainder of the division of `n` by `d` is zero.
3. `is_prime` a takes a non-negative integer `n` and checks whether it is a prime number.

**Important note:** You can assume that both `integer_square_root` and `multiple_of` exist, and that they are correct answers to the *Simple functions over integers* exercise from the previous sequence.

Once `is_prime` works, you can try writing a new version of it which is self-contained (that contains all definitions of auxiliary functions as locally defined functions).

## YOUR OCAML ENVIRONMENT

```
1 let rec gcd n m =  
2   if m = 0 then n else gcd m (n mod m);;  
3  
4 let rec multiple_upto n r =  
5   if r < 2 then false else  
6   if r = 2 || multiple_of n r = true then multiple_of n r else multiple_upto n (r - 1);;  
7  
8 let is_prime n =  
9   if n = 1 then false else  
10  not (multiple_upto n (integer_square_root n));;  
11 |
```

Computing gcd 10 1

Correct value 1

1 pt

Computing gcd 9 9

Correct value 9

1 pt

Computing gcd 7 9

|   |                   |
|---|-------------------|
| Computing gcd 3 6                         |                   |
| Correct value 3                           | 1 pt              |
| ✓ Exercise 2: multiple_upto               | Completed, 10 pts |
| Found multiple_upto with compatible type. |                   |
| Computing multiple_upto 10 3              |                   |
| Correct value true                        | 1 pt              |
| Computing multiple_upto 30 2              |                   |
| Correct value true                        | 1 pt              |
| Computing multiple_upto 25 6              |                   |
| Correct value true                        | 1 pt              |
| Computing multiple_upto 11 10             |                   |
| Correct value false                       | 1 pt              |
| Computing multiple_upto 6 6               |                   |
| Correct value true                        | 1 pt              |
| Computing multiple_upto 8 5               |                   |
| Correct value true                        | 1 pt              |
| Computing multiple_upto 3 5               |                   |
| Correct value true                        | 1 pt              |
| Computing multiple_upto 3 6               |                   |
| Correct value true                        | 1 pt              |
| Computing multiple_upto 8 1               |                   |
| Correct value false                       | 1 pt              |
| Computing multiple_upto 9 2               |                   |
| Correct value false                       | 1 pt              |
| ✓ Exercise 3: is_prime                    | Completed, 10 pts |
| Found is_prime with compatible type.      |                   |
| Computing is_prime 1                      |                   |
| Correct value false                       | 1 pt              |
| Computing is_prime 2                      |                   |
| Correct value true                        | 1 pt              |
| Computing is_prime 19                     |                   |
| Correct value true                        | 1 pt              |
| Computing is_prime 41                     |                   |
| Correct value true                        | 1 pt              |
| Computing is_prime 67                     |                   |
| Correct value true                        | 1 pt              |
| Computing is_prime 3                      |                   |
| Correct value true                        | 1 pt              |
| Computing is_prime 3                      |                   |
| Correct value true                        | 1 pt              |
| Computing is_prime 2                      |                   |
| Correct value true                        | 1 pt              |
| Computing is_prime 3                      |                   |
| Correct value true                        | 1 pt              |
| Computing is_prime 3                      |                   |
| Correct value true                        | 1 pt              |
